augmented reality is an interactive experience that combines the real world and computer generated content. The content can span multiple sensory modalities including visual, auditory, haptic, somatosensory, and olfactory. AR can be defined as a system that incorporates three basic features: a combination of real and virtual worlds, real-time interaction, and explained rad, rem, sieverts, becquerels, mit.

Others are more subtle, such as the difference between the raw physical units describing radiation emitted by a radioactive material measured in units like curies and becquerels, versus measurements designed to reflect the different amounts of radiation energy absorbed by a mass of material measured in rad or gray and those that

Toxic stress center on the developing child at Harvard University.

Tolerable stress response activates the body's alert systems to a greater degree as a result of more severe, longer-lasting difficulties such as the loss of a loved one, a natural disaster, or a frightening injury if the activation is time-limited and buffered by relationships with adults who help the child adapt the brain and other organs.
